Business Overview

Purpose: compare sales, customers, delivery and review scores to select management actions.

Data range: September 4, 2016 to October 17, 2018.

Trend window: January 2017 to August 2018; months outside this window have thin or uncertain coverage.

99,441 / 96,478	96,096	6.8%	4.09 / 5
orders / delivered	unique customers	late rate 6,534 late of 96,470 comparable orders	review score

Four Management Questions

- Business state: orders across the matched periods grew 135.1%.
- Customer behaviour: SP holds 41.9% of unique customers; the second-order rate is 2.4%.
- Strengths: 91.9% of comparable orders arrived early and 77.1% of reviews carry a high score.
- Needs review: the late rate rose from 3.5% to 7.7%.

Five-Point Summary

- Trend: matched-period orders went from 22,968 to 53,991.
- Customers: the top five states hold 77.1% of unique customers.
- Delivery: across the full period 6,534 of 96,470 comparable orders were late.
- Scores: mean review score of late orders is 2.27 vs 4.29 for the no-delay group.
- Products: delivered merchandise value is BRL 13,221,498.11 and office_furniture scores 3.64.

Findings: Orders and Customers

1 | Order and value trend — Chart 5.2, Tables 5.3 and 7.7

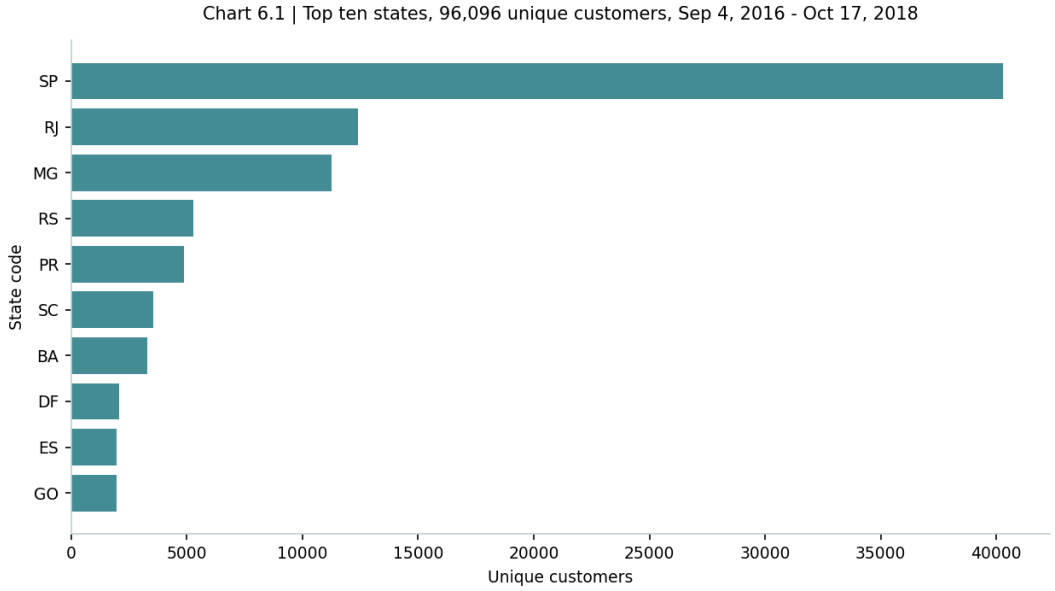

Across the two matched periods, orders grew from 22,968 to 53,991 (+135.1%). Delivered merchandise value rose from BRL 2,993,456.13 to BRL 7,218,125.12. The busiest month is November 2017 with 7,544 orders, coinciding with end-of-year campaigns such as Black Friday. Volume growth matters for capacity planning; its persistence is not guaranteed.

The continuous-window chart covers 99,092 orders, of which 22,133 belong to the middle months of September–December 2017; the two matched periods together hold 76,959 orders.

2 | Customer concentration — Chart 6.1, Tables 6.2 and 6.3

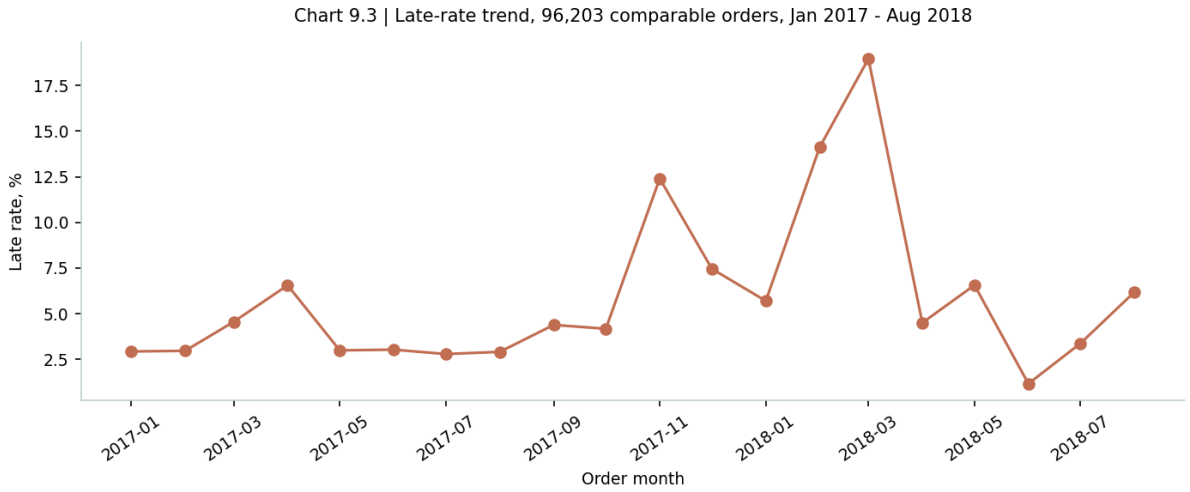

Of 96,096 unique customers, SP holds 41.9% and RJ 12.9%; the top five states hold 77.1% and the city of São Paulo alone 15.6%. Concentration in the leading states makes regional service planning important.

Findings: Delivery and Scores

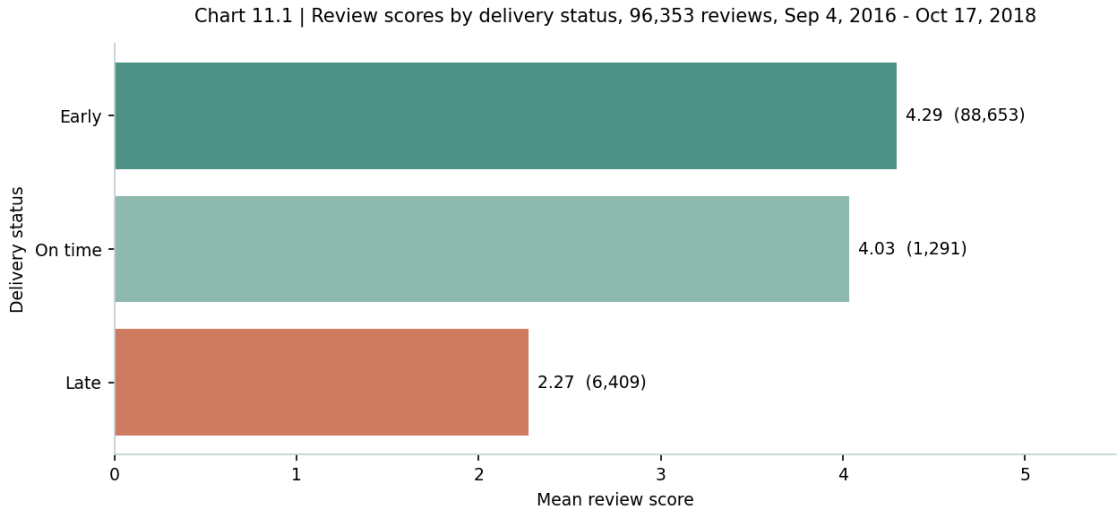

3 | Late rate — Chart 9.3, Tables 9.6 and 9.5

The late rate rose from 3.5% in January–August 2017 to 7.7% in the same months of 2018 — a gap of 4.2 percentage points. In March 2018 the rate reached 19.0% of 7,003 comparable orders, and in November 2017 it hit 12.4% alongside the sales peak. Monitoring delivery routes is a priority.

4 | Scores and delivery — Chart 11.1, Tables 11.2 and 11.3

The mean of 89,944 reviews on early/on-time orders is 4.29; the mean of 6,409 reviews on late orders is 2.27. For a 4–7 day delay the band score is 2.10 across 1,756 reviews. This relationship does not prove the cause of the score gap.

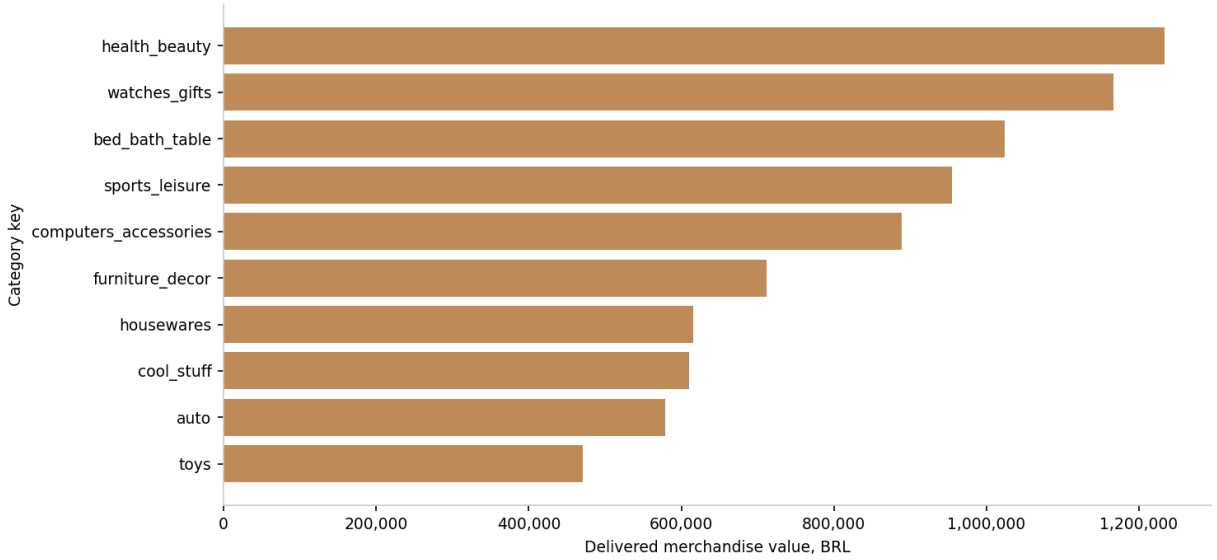

5 | Categories and Sellers

The top five categories hold 39.8% of delivered merchandise value. Category office_furniture carries 1,249 reviews, a score of 3.64 against the 4.09 average, and BRL 268,154.31 of value. These are starting points for reviewing the order experience (Table 10.8).

Category bed_bath_table scores 4.00; its 0.09 gap from the baseline sits below the 0.10 threshold, so it is not shortlisted. The gap is sensitive to the baseline choice: on a delivered-orders-only baseline it reaches 0.16 and crosses the threshold (Table 10.9 in the notebook).

Chart 7.2 | Top ten categories by delivered value, 110,197 items, Sep 4, 2016 - Oct 17, 2018

Excerpt of Table 12.7 | 2 of 4 selected sellers | September 4, 2016 to October 17, 2018

Shortened ID	Delivered value	Reviewed orders	Review score
4a3ca931	196,882.12 BRL	1,753	3.85
1ca7077d	12,474.64 BRL	107	2.39

The seller sample minimum is 30 reviewed orders. Seller 1ca7077d belongs to the broad screen and does not reach the strict value threshold.

Three Management Actions

1 | Delivery routes

Issue: the late rate rose from 3.5% to 7.7% in the second period (Table 9.6).

Regional evidence: RJ runs at 12.1% over 12,350 orders and AL at 21.4% over 397 orders (Table 9.4).

Action: run a pilot on a selected route alongside a comparison group to evaluate delay reduction.

Expected change: the pilot route's late rate moving toward the 6.8% overall average.

Monitoring: order count, late rate, delay days and actual delivery duration.

2 | Category and seller

Issue and evidence: office_furniture scores 3.64 against the 4.09 average of all reviews (Table 10.8).

Shortened ID 4a3ca931, with BRL 196,882.12 of value and 1,753 reviewed orders, is a review candidate (Table 12.7).

Action: review review texts and run an improvement test beside a comparison group to cut the share of low scores.

Expected change: a higher mean score for the selected category and sellers and a smaller share of 1–2 star reviews.

Monitoring: review count, mean score and the share of low-score reviews.

3 | Customer return

Issue and evidence: 1,827 of 77,482 equal-opportunity customers placed a second order — a 2.4% rate (Table 6.5).

Action: a limited retention experiment beside a comparison group to evaluate second-order growth.

Expected change: a higher 90-day second-order rate in the treatment group than in the control group.

Monitoring: second-order rate, size of each group and the cost of the action.

Strengths and Limitations

Strengths

• 88,644 of 96,470 comparable orders arrived early — a 91.9% share (Table 9.2).

• 77.1% of 99,224 reviews carry a high score (Table 10.1).

Payments and the Basis Gap

Total transactions amount to BRL 16,008,872.12. The gap to delivered merchandise value is BRL 2,787,374.01; payments also include freight and orders in other statuses (Table 8.4).

The 165,318.88 BRL difference compares payments with the items-plus-freight total across all statuses. The unavailable and canceled statuses contribute 124,339.02 BRL and 37,369.88 BRL respectively, and other statuses 3,609.98 BRL (Table 8.8). The cause of every difference is not clear in the data.

Limitations

• Delivered merchandise value excludes freight, costs and profit.

• Refund information and the cause of every payment difference is not available.

• Some categories, sellers and states are too small for comparison.

• Coverage of the first and last data months is uncertain.

• Not every order has a review and each review belongs to the whole order.

• The first recorded order is not necessarily the customer’s first real purchase.

• A statistical relationship alone does not prove cause or the certain outcome of an action.

• Category score gaps use the all-reviews baseline; on a delivered-orders-only baseline the borderline gaps differ (Table 10.9).
